AY2021 ID2116 Wk04: Object/OOP/StateTransition

Agenda:

- Object Oriented Programming
 - JavaScript Object:
 - Class
- Designing behaviour of your program
 - State Transition / Finite State Machine
- Connecting micro:bit ↔ p5*js
 - Web USB
 - BlueTooth

Mid-Term Project: "Algorithmic Agent"

<https://www.notion.so/clementzheng/Assignment-1-Algorithmic-Agent-b354abc36c2e42f6898a7dfd41c4fcc3>

Object Oriented Programming with p5.js

https://www.w3schools.com/js/js_objects.asp

What is Object?

JavaScript Object Example:

```
let fruitObj = {  
  key : value ,  
  name: "orange",  
  weight: 100,  
  origin: "USA",  
  eat: function() { print("Yummy!") },  
  weigh: function() { print( this.weight + "g") }  
}  
  
// There are two ways to refer object's property value.  
let val = objectName.name;           // val === "orange"  
let val2 = objectName["name"];       // val2 === "orange"  
  
fruitObj.eat();                       // printout "Yummy!"  
fruitObj.weigh();                     // printout "100g"
```

Object Example 01: Light Bulb

<https://editor.p5js.org/didny/sketches/o2xF4PK8f>

Object Example 02: music player

Week04: In Class Challenge - JS Objects

Animated square example: <https://editor.p5js.org/didny/sketches/uOopaKMHE>

Emoji agent example: https://editor.p5js.org/clement.zheng/sketches/zT_2JkKot

Challenge

Choose one example:

1. First, modify the appearance and behavior of the object.
2. Second, try adding new properties and functions to the object. Upload your p5.js code to slack.

[Optional] Class

A template for creating objects:

Class is a type of function to generate an object (instance) from a template. By defining a Class of an object you can instantiate(spawn) the objects without rewriting the properties.

Class Example: Bulb Class

Here is an example of spawning two light bulbs with the same properties.

https://editor.p5js.org/didny/sketches/ZpW_tMZ0

[Wk04 Weekly Exercise] Define daily object as a JavaScript "Object"

- Pick a simple object around you and try defining it in JavaScript Object Style.
-

```
objectName = {  
  property: "value",  
  method: function() { "type what to do" }  
}
```

Example: Paper

```
paper = {  
  size: A4  
  owner: Yuta  
  color: "white"  
  draw: function(scribble) {"draw a scribble on the paper"}  
  fold: function(time) { "fold the paper"}  
  tear: function(num) { "tear the paper in to num of pices"}  
}
```

Designing behaviours of Objects

State Transition / Finite State Machine

[Wk04 Assignment 1**]**

Define and draw a state transition diagram for the virtual pet

- Brainstorm ideas for your virtual pet. Make sure you review the [assignment brief](#).
- Shortlist an idea.
- Plan out the states and transitions for your virtual pet idea.
 - Include the states and transitions of both virtual pet elements (p5.js), the physical interaction elements (micro:bit), and the communication between them.
- Draw a detailed state transition of your project idea.
- Submit to Slack a PDF that includes:
 - A project description of the virtual pet (no more than 200 words).
 - Any relevant illustrations.
 - The state transition diagram of the virtual pet.
